

## Business Rule for Analysis Class of eProc System

How would the following business rule change your class diagram?

When we purchase an item from a vendor, we use the price the vendor has given us, if it is available. Otherwise, we enter the price.

Example: A buyer creates a PO for Vendor A. Line 1, the buyer chooses Item-X from the Item Master. Our application needs to look in Item-Vendor-Prices by the item number that the buyer selected and the vendor ID from the PO header. If the application finds a price for that Item & Vendor, it displays that price. Otherwise, the buyer must be able to enter a price for line 1, Item-X.
